

continual learning: Neuroscience + AI

How does the brain learn *c o n t i n u a l l y*?

Hippocampal Contributions

Hippocampal circuits are well defined

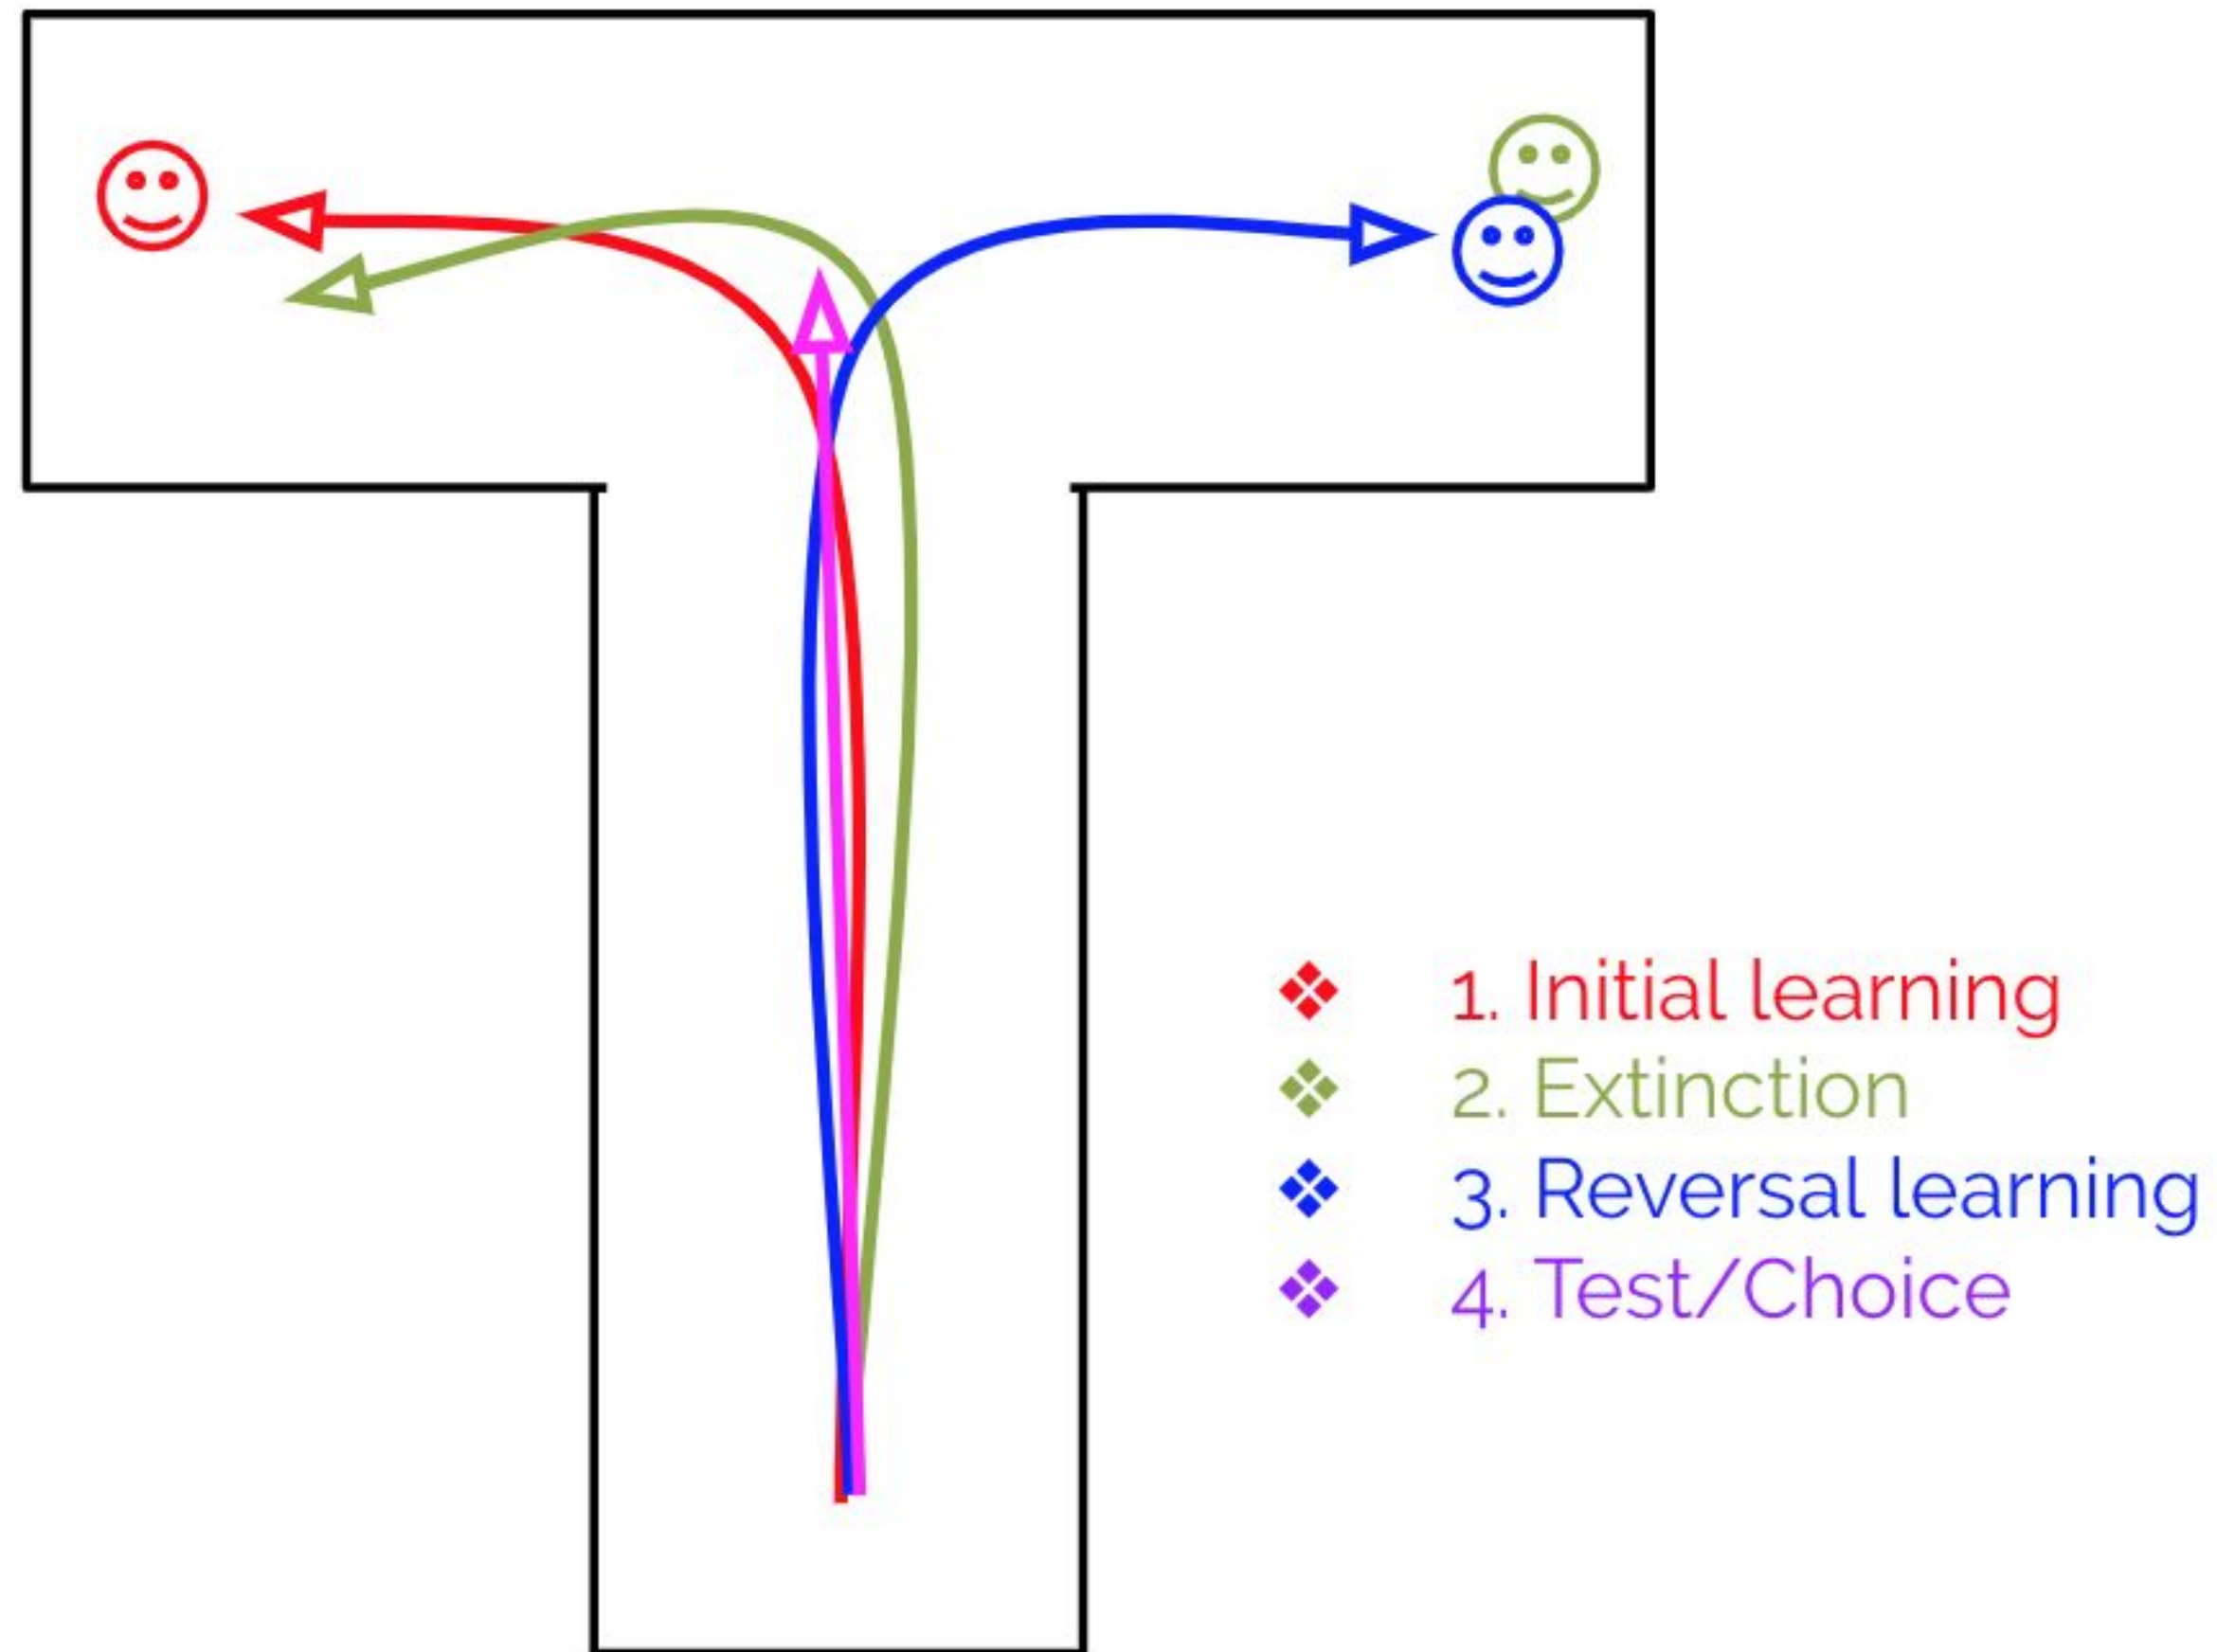

Circuit plasticity defined by Hebbian rules

Neuronal activity timed (theta rhythm (6-12 Hz))

Chemical modulation (acetylcholine)

Hippocampal Mode switching

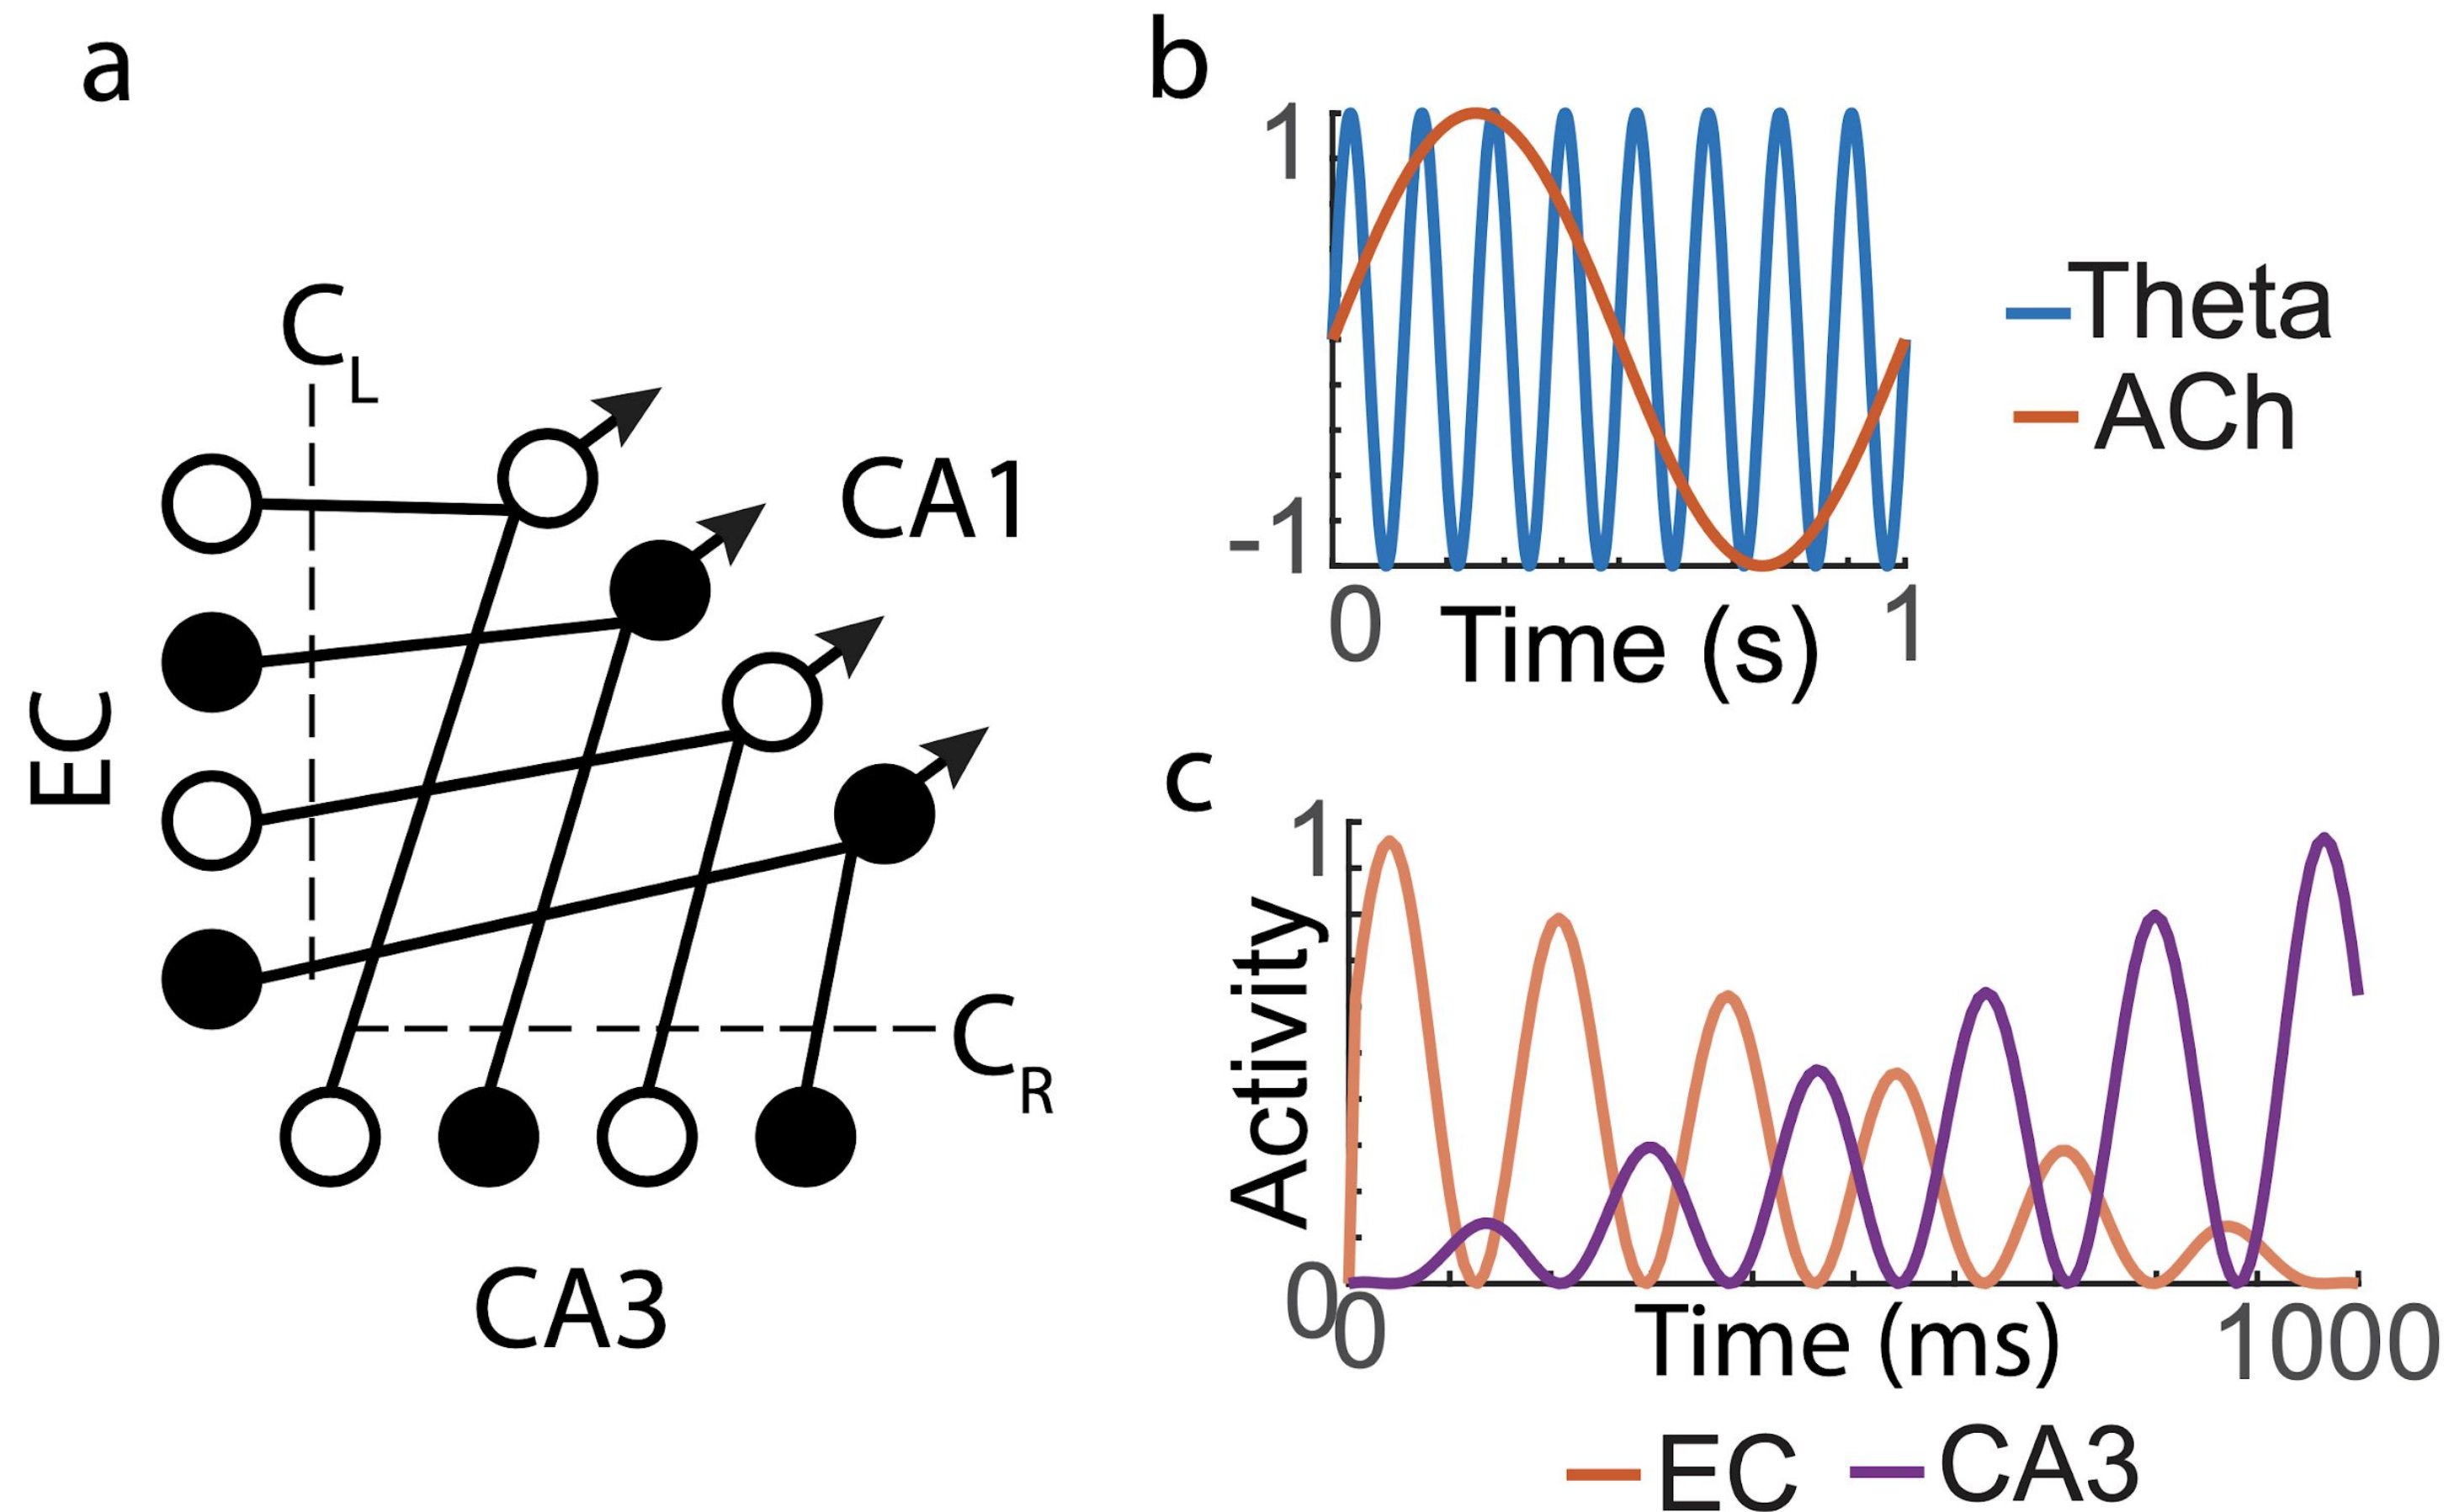

T - maze alternation task

Animal must prevent the association of the past reward interfering with the new location

Tabular Q learning methods cannot account for this?

Hippocampal Mode switching

A. Network model of EC, HPC, and cholinergic modulation

B. Varying timescales of theta and cholinergic activity

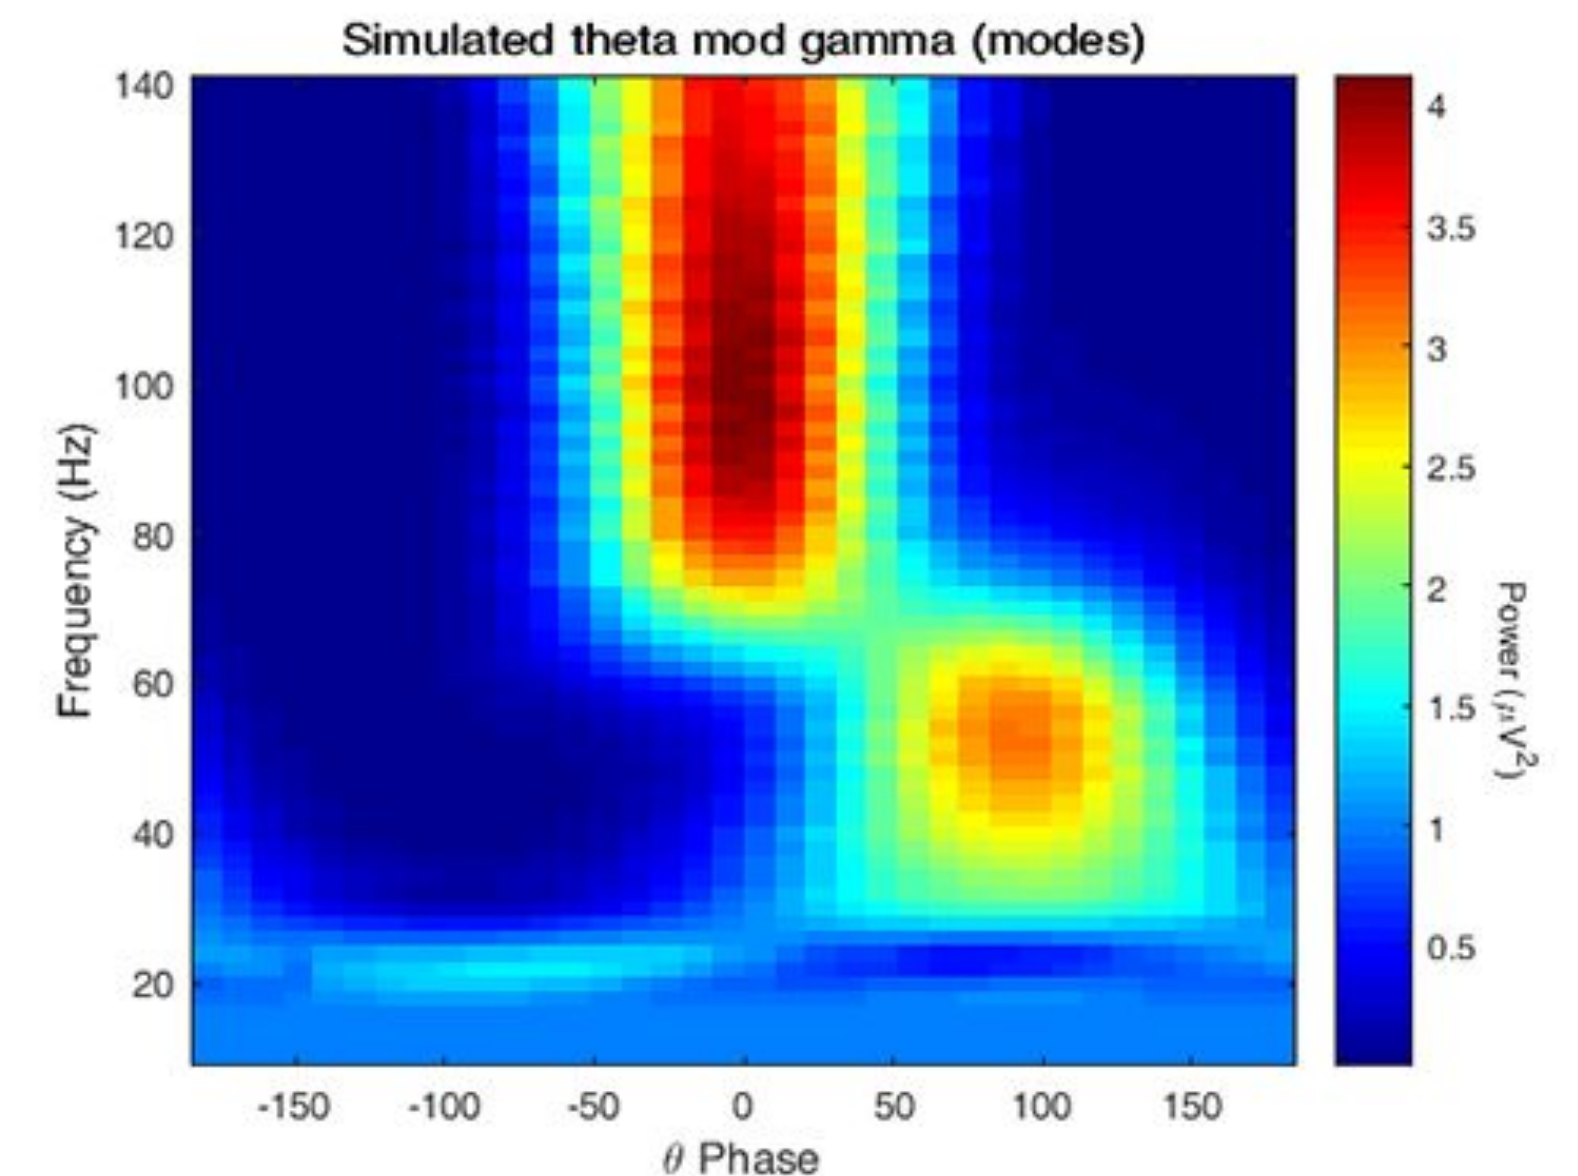

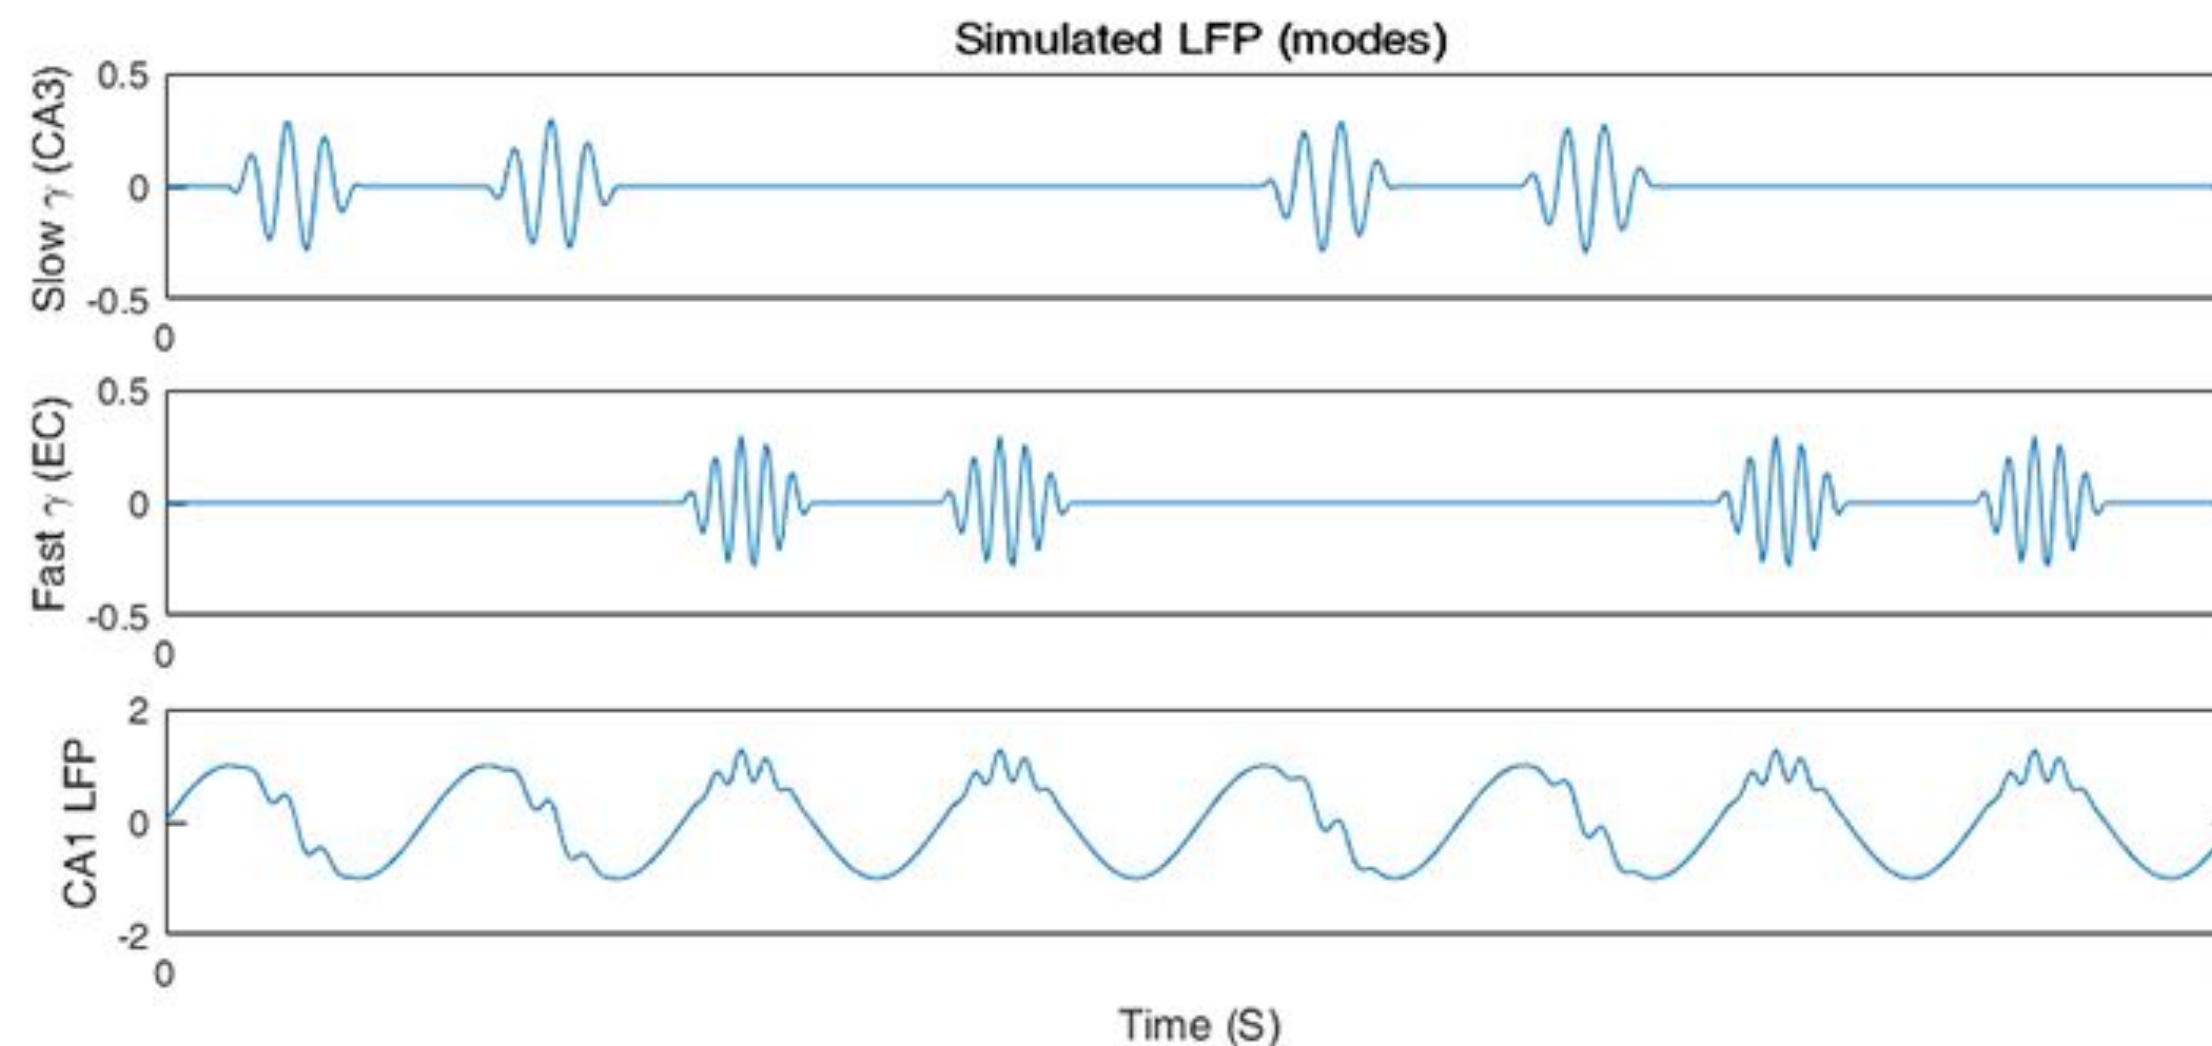

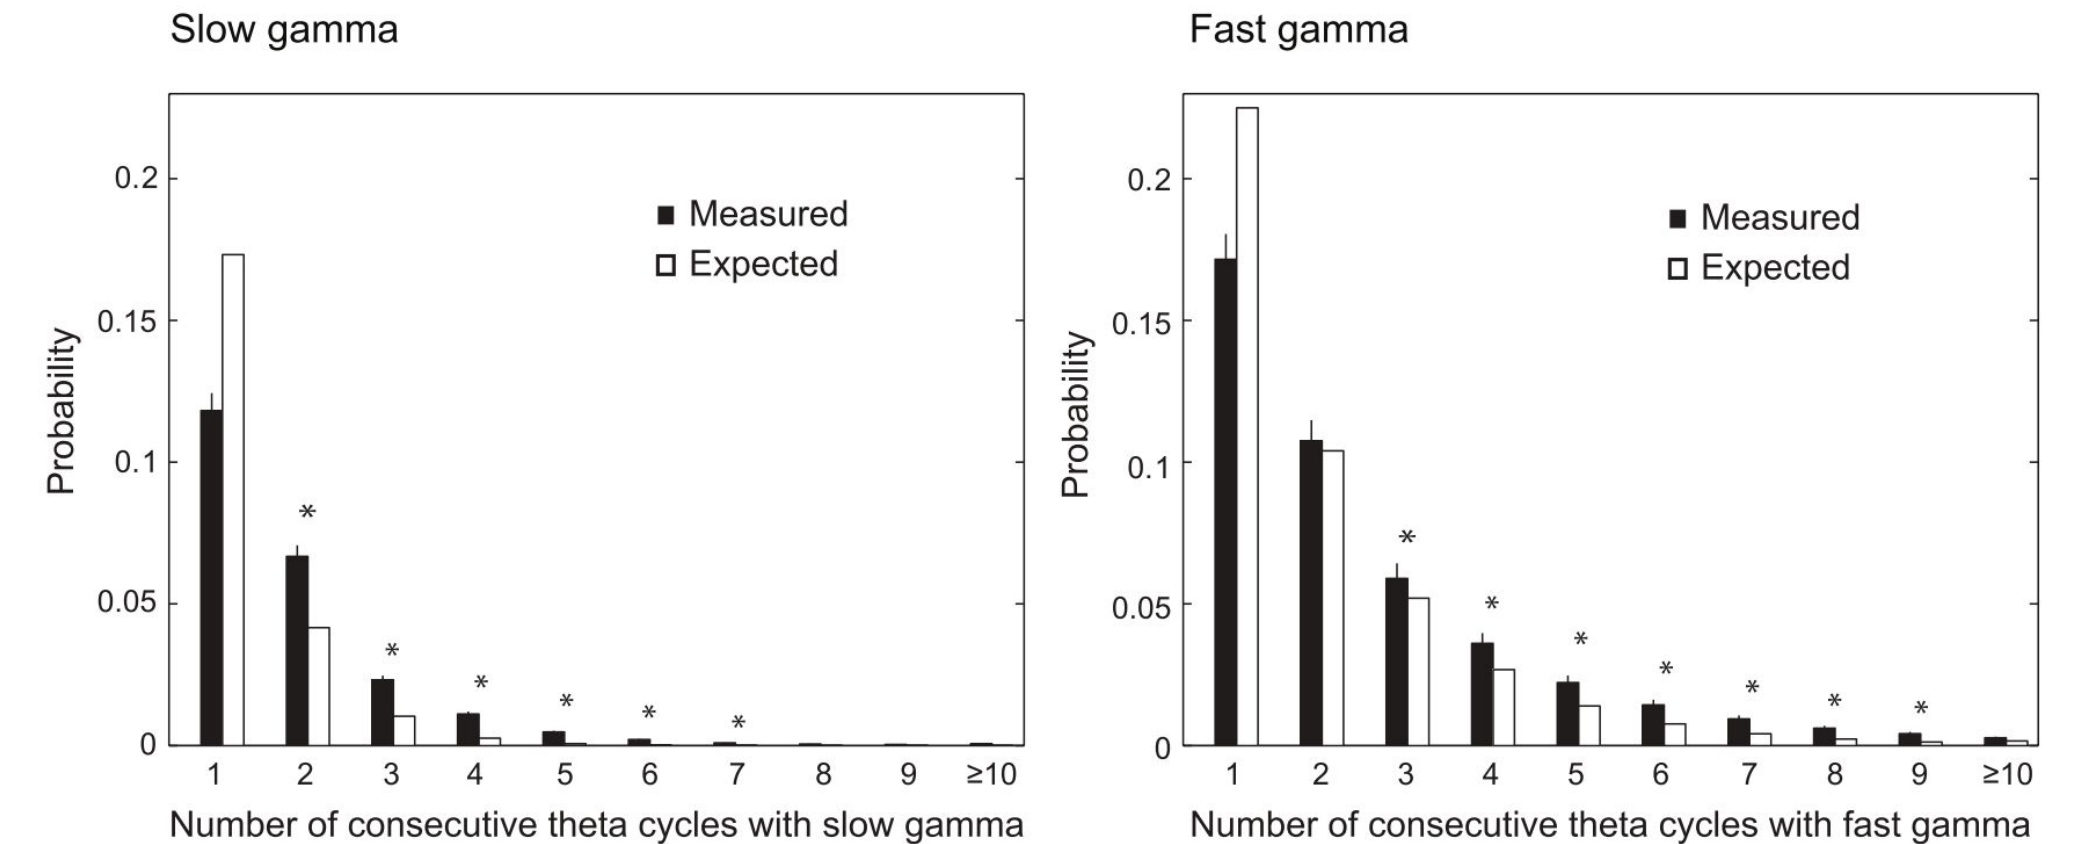

C. Scaling EC and CA3 activity across multiple mode timescales

Hippocampal Mode switching

Top figure from Colgin 2009: Fast and slow gamma are offset.

Below: output from the model, demonstrating modes of EC and CA3 activity.

EC: Fast gamma, CA3: Slow gamma

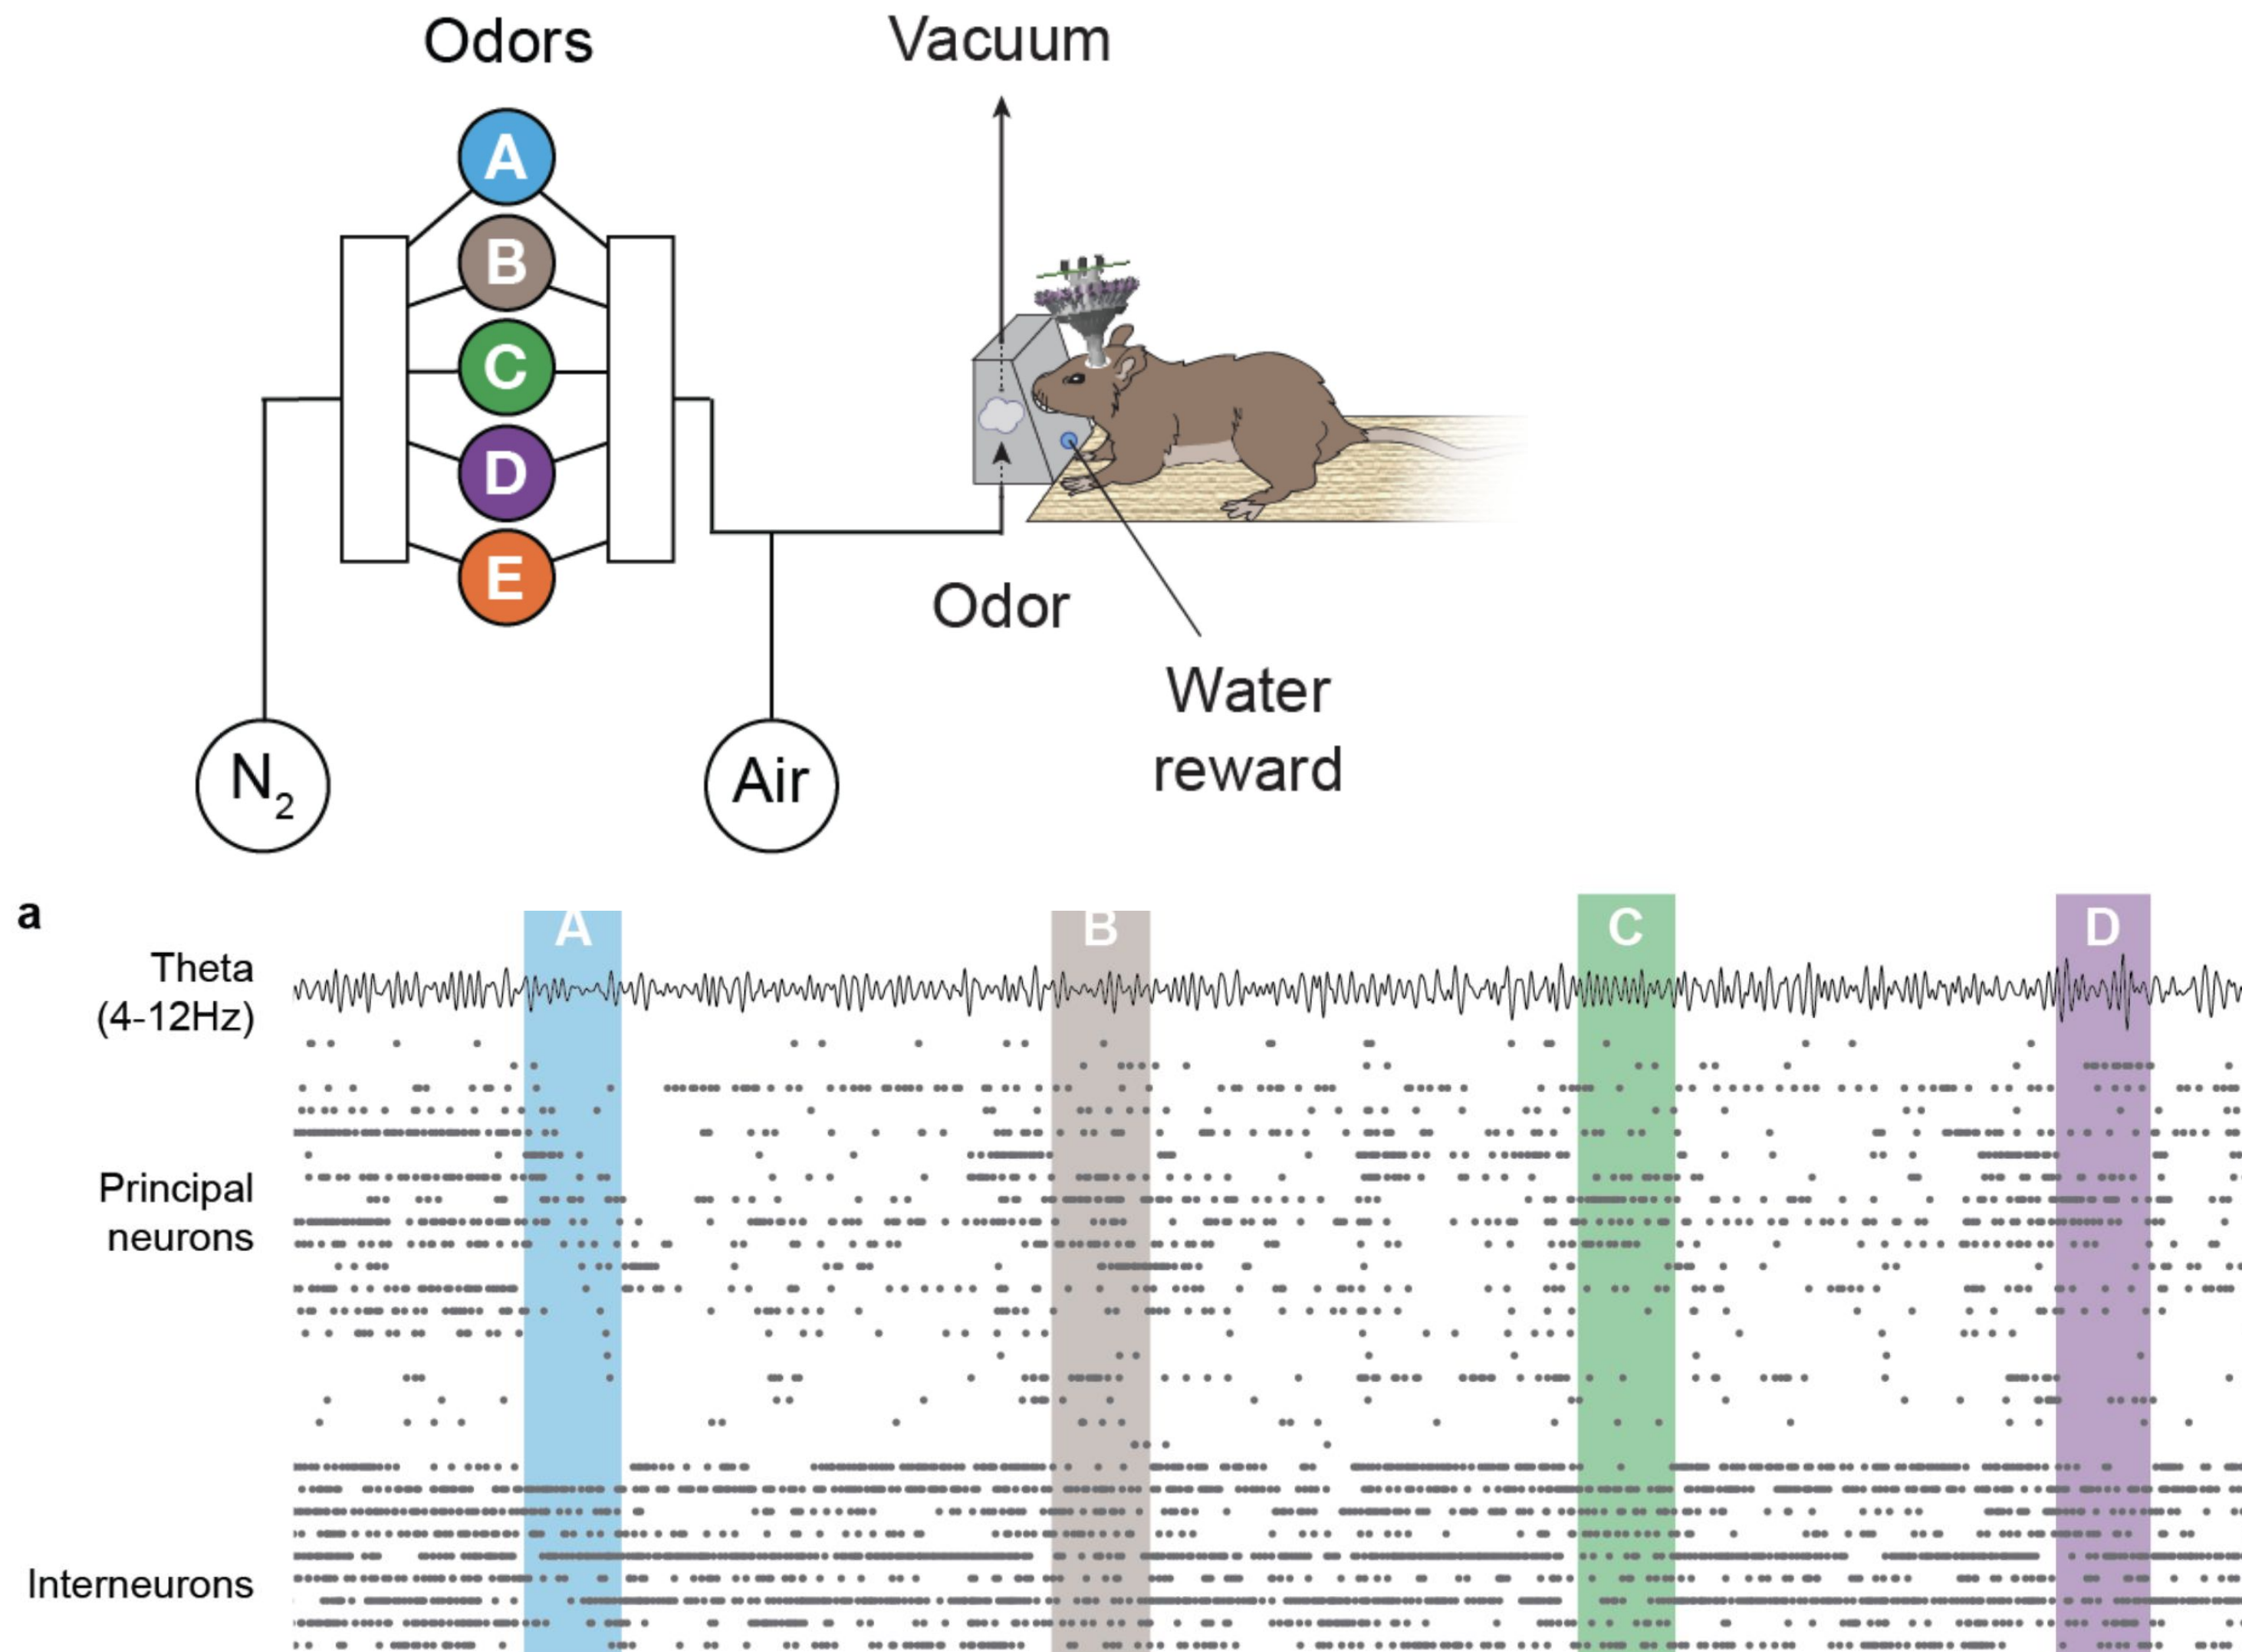

Sequence decoding

presented a sequence of odors.

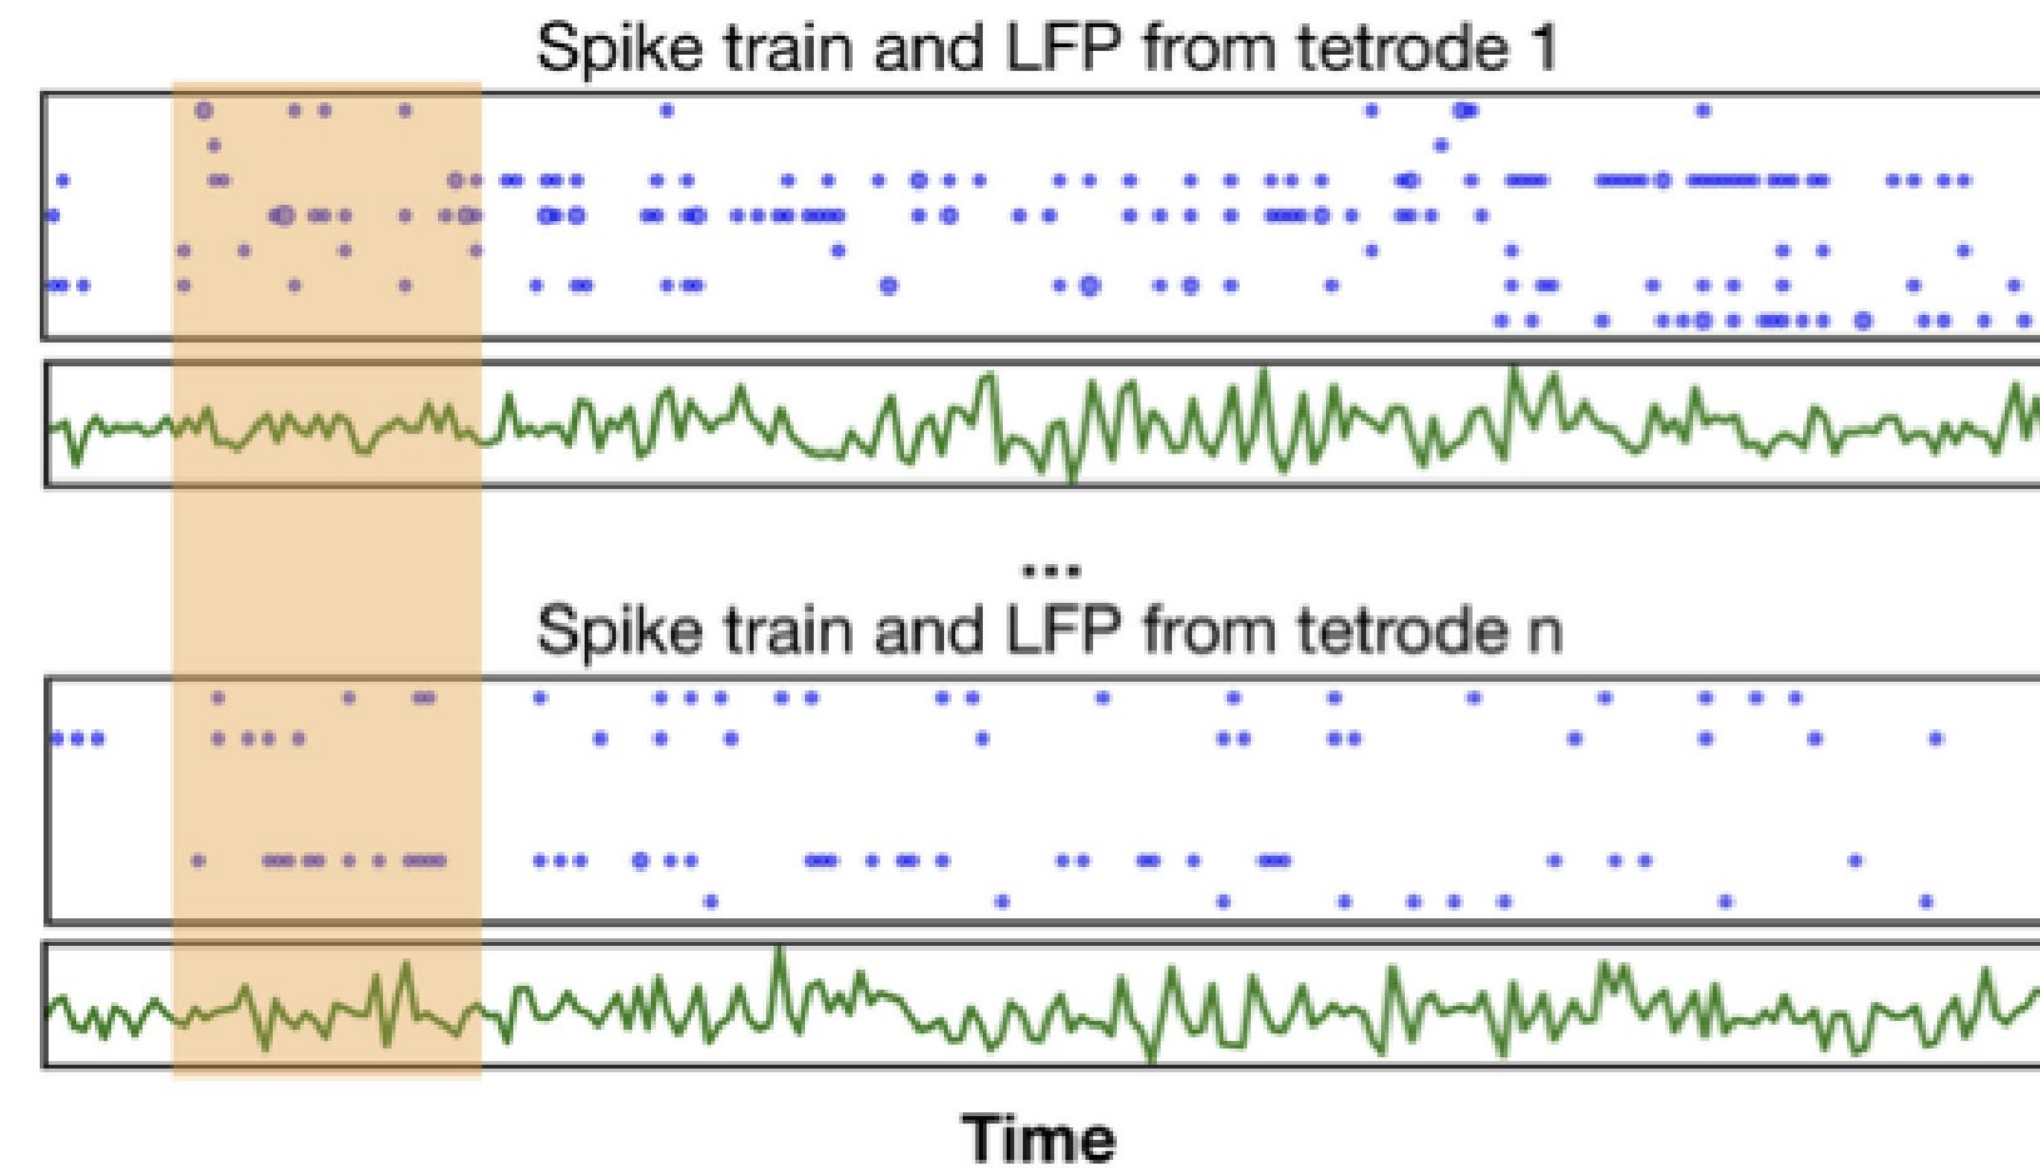

Rewarded for “correct sequences”

if incorrect, animal must leave port

CA1 tetrode recordings

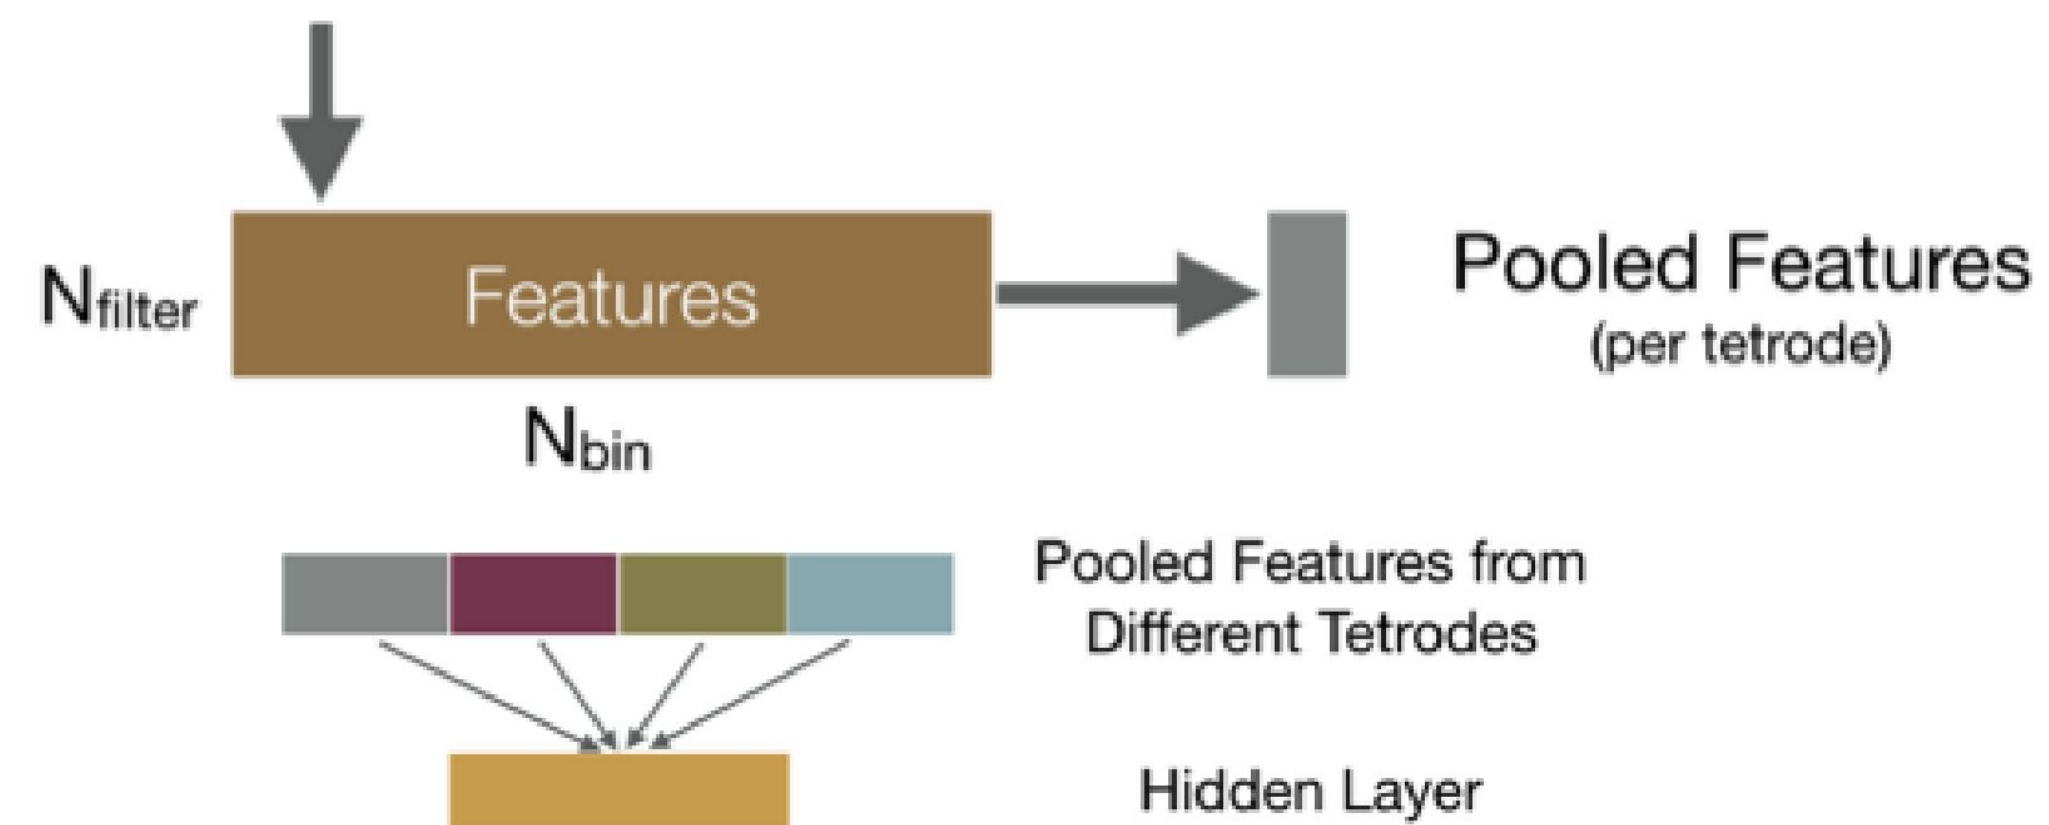

Sequence decoding

CNN using LFP & spike as input features

output: probability of odor

Sequence decoding

SuperChris odor = 1 Decoding

Trial by trial odor decoding
(Darker higher probability)

Sequences display a sort of
predictive coding

Activity of next item increases

Sleep Replay

Replay, a common technique to overcome CF

Sleep Replay

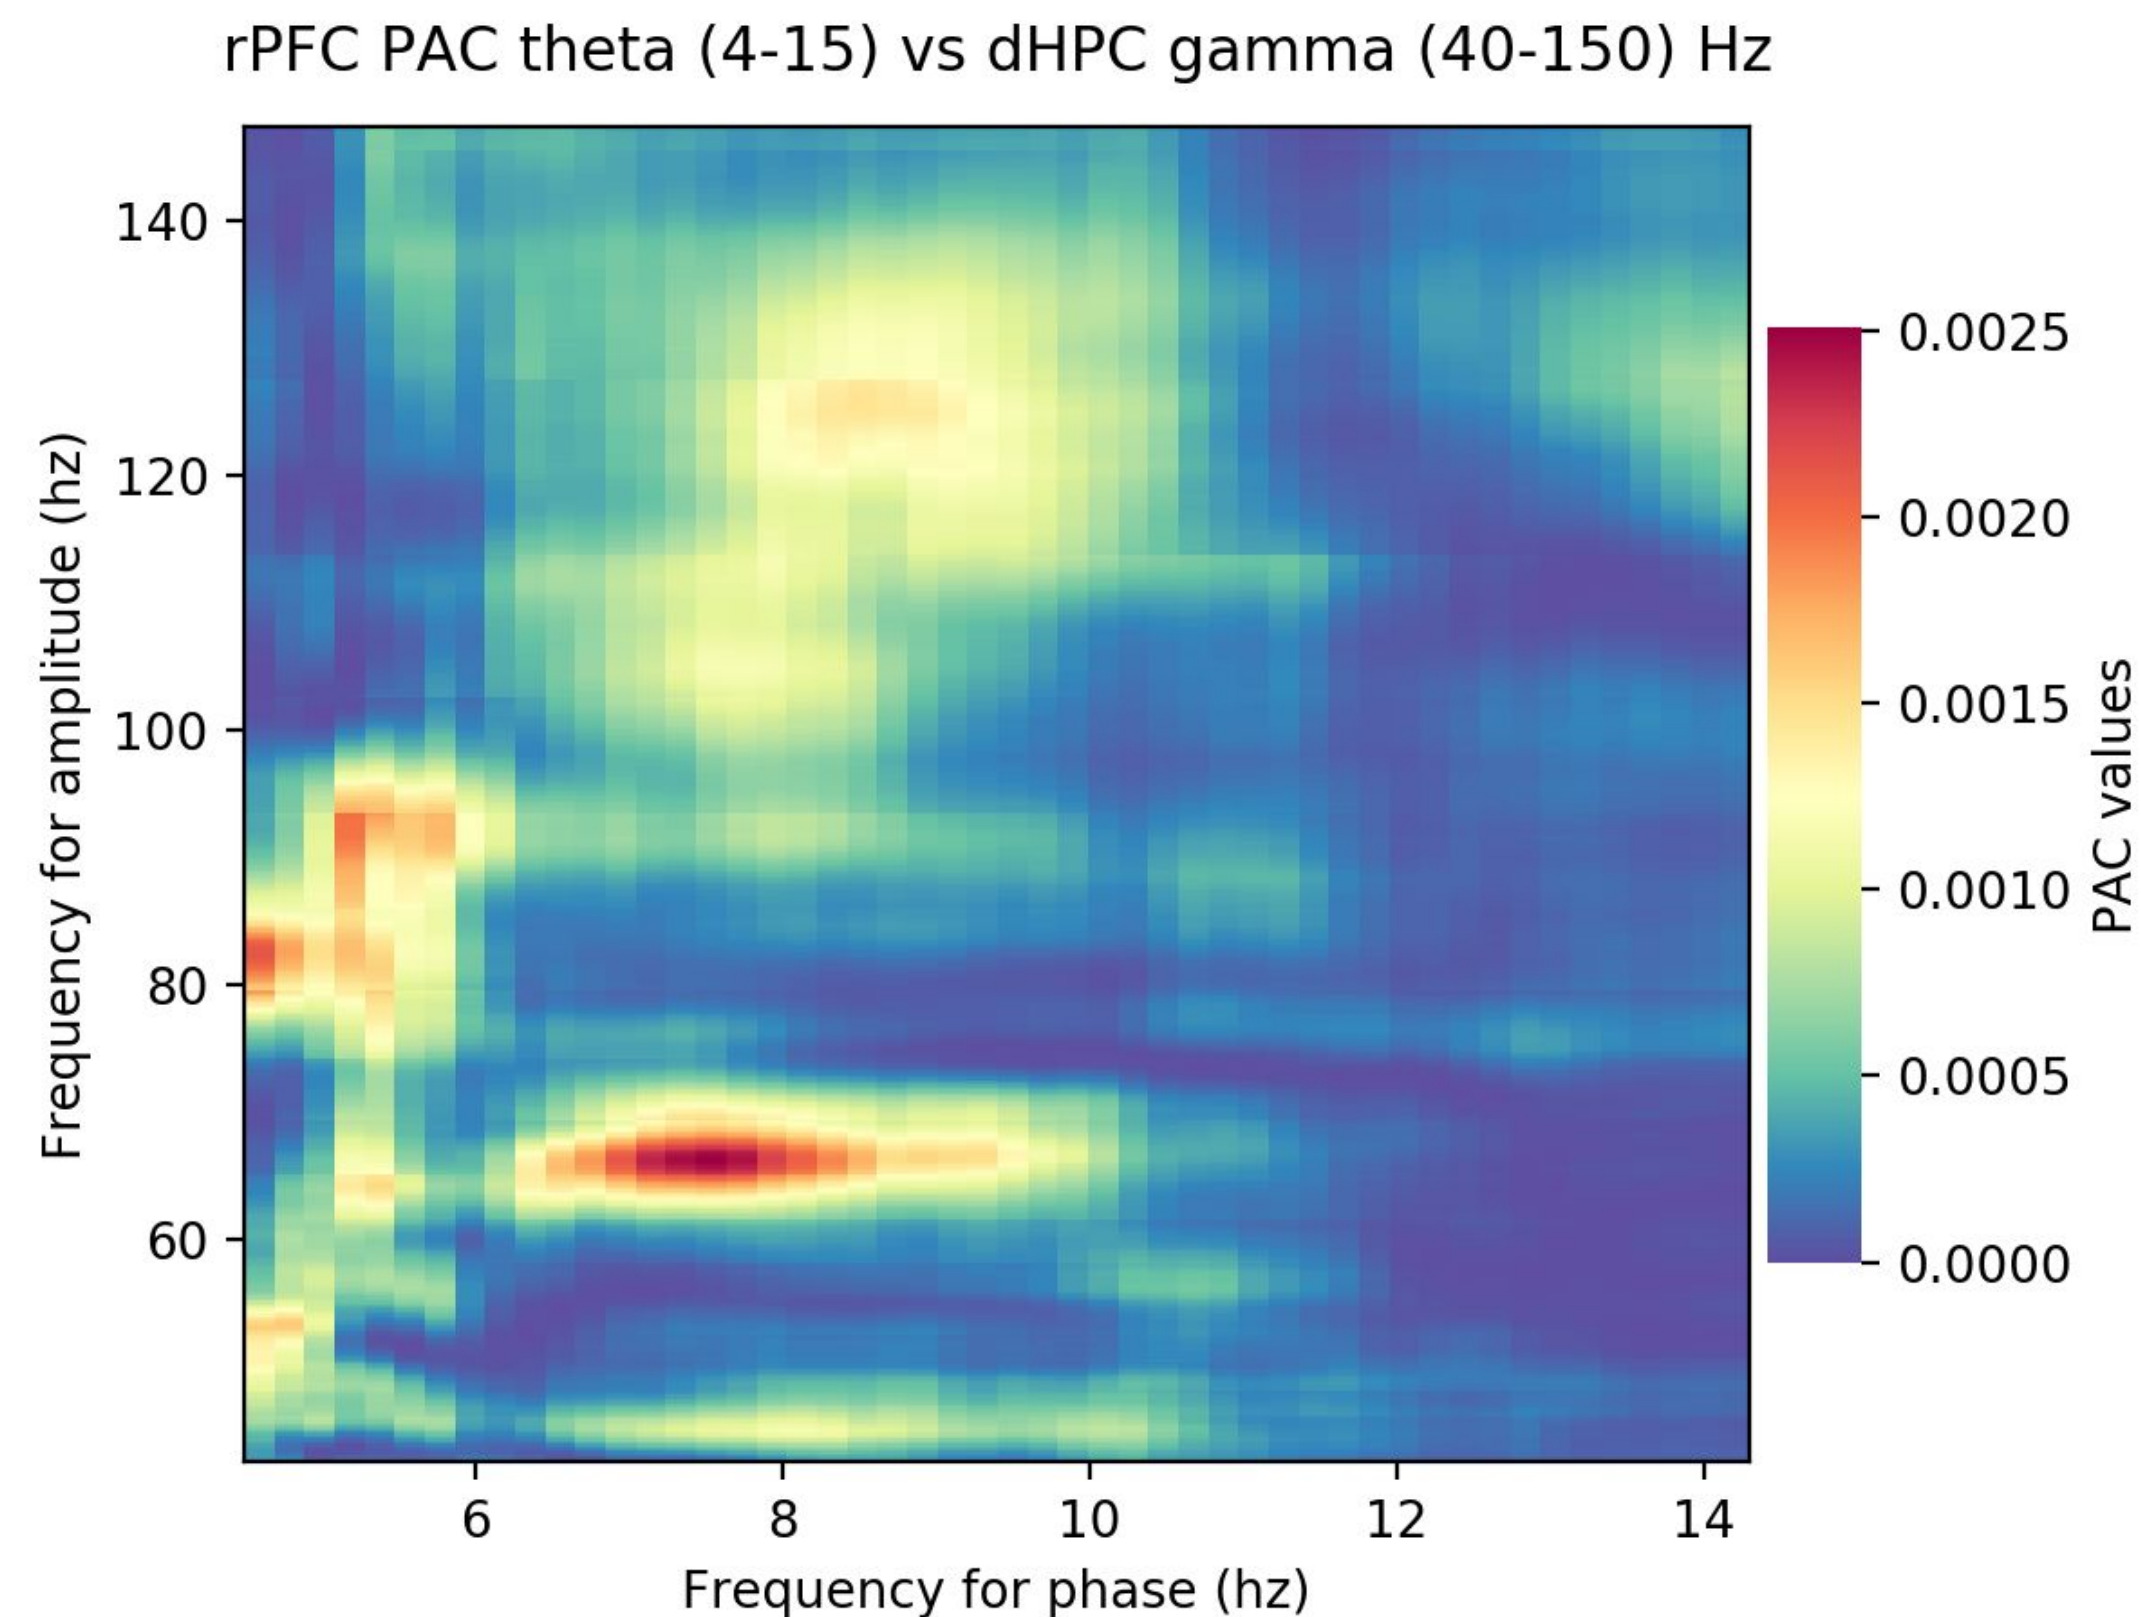

Cortex spiking data during waking and sleep

HPC / CTX PAC

Phase amplitude coupling has also been shown to display information exchange and directionality similar to granger causality (Nandi et al 2019)

One example of this is dvHPC vs right PFC coupling:
